

## DO NOT SHORTEN

Do not cut anything off this VORTEX Exhaust. It is designed to work correctly at the length supplied. Shortening the product will affect its performance.

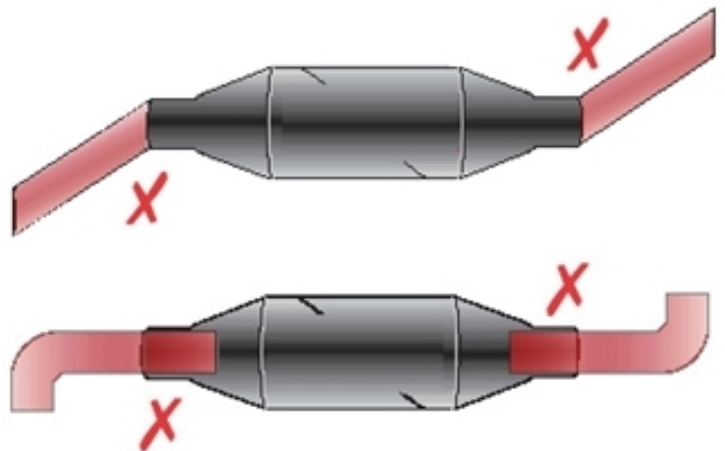

## INCORRECT PIPE FITTING

Do not angle inlet and outlet pipes.

There must be no angled pipe at either end of the VORTEX Exhaust. This will affect its performance.

Do not insert engine or tail pipe any more than 40mm inside the VORTEX Exhaust. This will affect its performance.

## CORRECT PIPE FITTING

Minimum of 80mm of straight pipe before any bends. Pipe must be welded for best results, but may be clamped if result is airtight.

USED GAS MUST HIT THE CENTRE OF THE VORTEX

## IMPORTANT NOTE

VORTEX exhausts are designed to make your engine perform more efficiently. This will only be possible if the VORTEX unit is fitted correctly. We therefore strongly recommend this component be installed at a specialist exhaust centre. The manufacturers and distributors of the VORTEX Exhaust take no responsibility if the above is not adhered to.
